

# Types of Clustering Algorithms

## Table of Contents

1. How clustering is different from classification
2. Applications of Clustering
3. What are density based methods
4. What are Hierarchical based methods
5. What are partitioning methods
6. What are Grid Based methods
7. Main Requirements for Clustering Algorithms

## unsupervised learning Algorithms. (pg no 5 Reference)

- 1) K-Means
- 2) Hierarchical clustering
- 3) DBSCAN
- 4) performance measurement
- 5) Principal component Analysis
- 6) Dimensionality Reduction.

clustering - Evaluation metrics for clustering are Important

### \*) clustering:-

→ First we need to understand clustering is different from classification.

Parameter	classification	clustering
1) TYPE	used for supervised learning.	used for unsupervised learning.
2) Basic	Process of classifying the input instances based on their corresponding <u>"labels"</u> .	Grouping the instances based on their <u>similarity</u> <u>"without the help of class labels"</u> .
3) complexity	more complex	less complex
4) Example Algo	Logistic Regression, Naive Bayes, SVM etc - <b>KNN</b>	K-Means clustering, Hierarchical clustering, DBSCAN, BIRCH Algorithm, etc

## Applications of clustering

### → For customer segmentation

You can cluster your customers based on their purchases, their activity on website and so. And this can be used in Recommendation systems to suggest content that other user in same cluster enjoyed (Chung).

Eg marketing, insurance, Libraries etc.

### → Earth-quake studies

By learning old data it can make clusters and determine dangerous zones.

### → For search engines

As you search, similar images would end up on same cluster.

### → to segment an image

By clustering pixels according to their color, then replacing each pixel's color with the mean color of its cluster, it is possible to reduce no. of different colors in image.

Eg used in object detection & tracking systems.

### → For Anomaly detection (outlier)

→ A dimensionality Reduction Technique.

→ For Data Analysis

## clustering methods

### ① Density-Based Methods

these methods consider the clusters as dense region having some similarity and different from the lower dense region or space.

these methods have good accuracy & ability to merge two clusters.

eg

i) DBSCAN [Density Based Spatial Clustering of Applications with Noise]

ii) OPTICS [Ordering Points to Identify Clustering Structure.]

### ② Hierarchical-Based Methods

The clusters formed in this method form a tree-type structure based on the hierarchy. New clusters are formed using the previously formed one. It has two categories.

i) Agglomerative

Bottom up approach -  
forms a single cluster & expands

ii) Divisive

Top down approach -  
forms a big cluster & divides

eg

iii) CURE [Clustering Using Representatives]

iv) BIRCH [Balanced Iterative Reducing Clustering and using Hierarchical]

### ③ Partitioning methods:-

these methods partition the objects into  $k$ -clusters and each partition forms one cluster. this method is used to optimize an objective criterion similarity function such as when the distance is a major parameter.

egs

i) K-means

ii) CLARANS [Clustering Large Applications based upon Randomized Search]

### ④ Grid-Based methods:-

In this method the data space is formulated into a finite no. of cells that form a grid like structure. All the clustering operation done on these grids are fast and independent of the no. of data objects.

egs

i) STING [Statistical Information Grid]

ii) CLIQUE [Clustering In QUEst]

iii) wave cluster, etc.

## Main Requirements for clustering Algorithms

- ① It should be Scalable.
- ② It should be able to deal with attributes of different type.
- ③ It should be able to discover arbitrary shape clusters.
- ④ It should have an inbuilt ability to deal with Noise & outliers.
- ⑤ The clusters should not vary with the order of input records.
- ⑥ It should be able to handle data of high dimension.
- ⑦ It should be easy to interpret & use.
